

FABRICATION & ASSEMBLY

We provide a variety of in-house solutions, including machining, robotic welding, flash butt welding, pressing, swaging, and bending.

We offer a diverse range of in-house fabrication and assembly processes that enable the complete supply of a wide range of components. Fabrication can involve a variety of techniques such as cutting, bending, forming, profiling, cropping, punching, welding, or machining.

Once the individual parts are fabricated, they move to the assembly stage, where they are meticulously put together. This often involves fastening components using methods like bolting, riveting, and welding.

Diversification is our greatest strength and the entire process aims to produce a finished product that meets specific design, functionality, and quality requirements outlined by our customers.
