

## BENDING

We provide both cold and hot bending solutions for the complex forming of heavy sections that often exceed the capabilities of traditional section benders.

Over the past 50 years, we have gained extensive knowledge and expertise in bending both components and raw materials. We utilise conventional machinery as well as specially designed equipment and testing jigs.

We pride ourselves on being non-standard specialists, capable of bending a wide variety of bar and plate sections, including unique "heavy" sections that can be challenging to source from traditional suppliers and manufacturers.

Metal bending is a fundamental fabrication process that reshapes flat sheets, solid bars, and other metal forms into desired angles or curves. This process can be performed either hot or cold, with each method offering distinct advantages and applications.
